Understanding the Foundation

The Analytic Brainstorming Process

Analytic brainstorming unlike traditional methods that often rely on freeflowing ideas systematically analyzes the problem or opportunity before generating solutions

Its a structured approach that leverages critical thinking research and diverse perspectives to produce more relevant and impactful ideas

Phase 1 Deep Dive Analysis

Before generating any ideas understand the core issue This involves a thorough examination asking critical questions like

- What is the problem or opportunity Define it precisely
- Avoid ambiguity
- What are the underlying causes Delve beyond the surfacelevel description to identify the root issues
- What are the key stakeholders involved Understanding their needs and motivations will influence the best possible solutions
- What are the current constraints

Financial logistical and technological limitations shape the feasible solutions

- What are the market trends and competitor strategies

Understanding the environment is crucial for developing unique offerings

Research and Gather Data

Look for relevant data statistics and insights Use online resources industry reports and surveys to support your analysis

Phase 2 Generating Creative Solutions

Now armed with thorough analysis brainstorm solutions by applying these techniques

- Mind Mapping** Visualize connections and relationships between ideas Start with the central problem and branch out to possible solutions
- SCAMPER** A creative problemsolving technique that helps you modify existing products services or processes to create novel ideas
 - S**ubstitute
 - C**ombine
 - A**dapt
 - M**odify
 - P**ut to other uses

biodegradable polymers are an important class of polymers due to their good biodegradability and biocompatibility the research and application of biodegradable polymers in biomedical fields have attracted extensive attention especially in that of drug delivery tissue engineering and regenerative medicine biodegradable polymers can

be broken down in vivo through enzymatic and non enzymatic degradation for biomedical applications the chemical and mechanical properties degradation mechanism and products and other factors of the polymers play a critical role in their degradation behaviors and application thus many essential issues must be considered in the design of biodegradable polymers for biomedical application for instance sufficient mechanical strength is important for scaffold materials to provide three dimensional space for cells and its degradation rate must be compatible with tissue regeneration when used as the drug carriers for some implants controllable degradation rate is also required for the biodegradable polymers to avoid explosive release besides good permeability more importantly the biodegradable polymers must have good biocompatibility to avoid adverse reactions such as inflammation in the body and the degradation products must be non toxic and should not be accumulated in the body to meet such requirements the chemical and physical as well as the degradation properties of polymers must be properly tailored
