composite materials are heterogeneous by nature and are intended to be since only the combination of different constituent materials can give them the desired combination of low weight stiffness and strength at present the knowledge has advanced to a level that materials can be tailored to exhibit certain required properties at the same time the fact that these materials are composed of various sometimes very different constituents make their mechanical behaviour

complex this observation holds with respect to the deformation behaviour but especially with respect to the failure behaviour where complicated and unconventional failure modes have been observed it is a challenge to develop predictive methods that can capture this complex mechanical behaviour either using analytical tools or using numerical methods the finite element method being the most widespread among the latter in this respect developments have gone fast over the past decade indeed we have seen a paradigm shift in computational approaches to composite material behaviour where only a decade ago it was still customary to carry out analyses of deformation and failure at a macroscopic level of observation only one may call this a phenomenological approach nowadays this approach is being progressively replaced by multiscale methods in such methods it is recognized a priori that the overall behaviour is highly dependent on local details and flaws
