The book offers cutting edge insights into AI driven optimization algorithms and their crucial role in enhancing real time applications within fog and edge IoT networks and addresses current challenges and future opportunities in this rapidly evolving field. This book focuses on artificial intelligence induced adaptive optimization algorithms in fog and edge IoT networks. Artificial intelligence fog and edge computing together with IoT are the next generation of paradigms offering services to people to improve existing services for real time applications. Over the past few years there has been rigorous growth in AI based optimization algorithms and edge and IoT paradigms. However, despite several applications and advancements there are still some limitations and challenges to address including security, adaptive, complex and heterogeneous IoT networks, protocols, intelligent offloading decisions, latency, energy consumption, service allocation and network lifetime. This volume aims to encourage industry professionals to initiate a set of architectural strategies to solve open research computation challenges. The authors achieve this by defining and exploring emerging trends in advanced optimization algorithms, AI techniques and fog and edge technologies for IoT applications. Solutions are also proposed to reduce the latency of real time applications and improve other quality of service parameters using adaptive optimization algorithms in fog and edge paradigms. The book provides information on the full potential of IoT based intelligent computing paradigms for the development of suitable conceptual and technological solutions using adaptive optimization techniques when faced with challenges. Additionally, it presents in depth discussions in emerging interdisciplinary themes and applications reflecting the advancements in optimization algorithms and their usage in computing paradigms. Audience: researchers, industrial engineers and graduate/post graduate students in software engineering, computer science, electronic and electrical engineering, data analysts and security professionals working in the fields of intelligent computing paradigms and similar areas.

along with the use of other technological tools such as sensors the proliferation of social media websites like google facebook and twitter as well as other similar platforms are accountable for the generation of a sizeable amount of brand new information all over the world this data is compiled and stored in various databases for potential use in the future the sensors are used to collect information from the physical environment and communicate it to the computer social media websites provide a high level platform for users to analyze market chapters and make decisions an analyst or data scientist will on a day to day basis face a variety of challenges some of which include the following obtaining the data storing the data sharing the data sending the data analyzing the data and displaying the results of the analysis some of these challenges include obtaining the data storing the data sharing the data sending the data analyzing the data and displaying the results of the analysis after coming to the realization that overcoming all of the difficulties listed above would not be a simple feat we decided to concentrate our efforts primarily on data filtering because we anticipated that the process of filtering would be the most difficult obstacle to overcome we devised a plan that would center on the categorization of the data that is present in our immediate environment simply put there is an excessive amount of data to be regulated in such a manner and expect it to be successful it is useless and has no sense until those giant characteristics with unbelievable dimensions are identified and it consists of enormous characteristics with huge dimensions until then it is meaningless and has no sense it is essential to transform these high dimensional data into low dimensional data so that a more effective machine learning model can be developed to classify the data and so that the processing of the data may be simplified it is possible to rapidly train the high accuracy model utilizing low dimensional data which involves significantly less effort and time than traditional methods when we engage in activities in the real world we are frequently put in situations in which we are confronted with information and things that to be properly labelled require some form of classification it is a very critical responsibility to check and see that both the data and the item in question have the right labels to describe what they are

and robotics are distinct ideas or if they are interchangeable artificial intelligence vs robotics the technology of computing serves as the basis for artificial intelligence ai the process involves the development of software that computers can use to do tasks that were previously performed by people requiring intelligence the capabilities of artificial intelligence systems include the ability to learn observe solve problems grasp language and reason rationally artificial intelligence may be used in a wide variety of modern applications ranging from personal assistants to autonomous vehicles there is a continuous progression taking place in the area of artificial intelligence ai in spite of this artificial intelligence is occasionally depicted in science fiction as being as lifelike as is physically possible in robot form nevertheless robotics is a discipline of computer science that focuses on the study of robots like these robots which are programmable machines are often capable of carrying out a series of activities either entirely or partly on their own one must possess all three of the following characteristics in order to be classified as a robot through the use of their sensors and actuators robots interact with the environment that they are in automatons may be programmed by you the vast majority of robots are capable of functioning on little or no supervision from humans due to the fact that certain robots do not have the capability to function alone the word usually is used to characterize robots for example even if they are only controlled by humans telerobots are still regarded to be a branch of robotics for the purpose of classification long term robots that are driven by artificial intelligence will link the two areas the operation of these mechanical creatures is carried out by intelligent computer software the majority of robots do not possess any kind of artificial intelligence up until quite recently all industrial robots were restricted to doing the same set of duties simultaneously we have previously shown that artificial intelligence is not required for jobs that are routine and repetitive there are significant limitations placed on the capabilities of robots that lack intelligence algorithms that are based on artificial intelligence are often necessary in order to make it possible for robots to perform more complex tasks
