groundwater constitutes an important component of many water resource systems supplying water for domestic use for industry and for agriculture management of a groundwater system an aquifer or a system of aquifers means making such decisions as to the total quantity of water to be withdrawn annually the location of wells for pumping and for artificial recharge and their rates and control conditions at aquifer boundaries not less important are decisions related to groundwater quality in fact the quantity and quality problems cannot be separated in many parts of the world with the increased withdrawal of ground water often beyond permissible limits the quality of groundwater has been continuously deteriorating causing much concern to both suppliers and users in recent years in addition to general groundwater quality aspects public attention has been focused on groundwater contamination by hazardous industrial wastes by leachate from landfills by oil spills and by agricultural activities such as the use

of fertilizers pesticides and herbicides and by radioactive waste in repositories located in deep geological formations to mention some of the most acute contamination sources in all these cases management means making decisions to achieve goals without violating specified constraints in order to enable the planner or the decision maker to compare alternative modes of action and to ensure that the constraints are not violated a tool is needed that will provide information about the response of the system the aquifer to various alternatives
