anyone who has ever tried to present a rather abstract scientific subject in a popular manner knows the great difficulties of such an attempt either he succeeds in being intelligible by concealing the core of the problem and by offering to the reader only superficial aspects or vague allusions thus of deluding the reader by arousing in him the deceptive illusion of comprehension or else he gives an expert account of the problem but as the untrained reader is unable to follow the exposition and becomes discouraged from reading any further if these two categories are omitted from today's popular scientific literature surprisingly little remains but the little left is very valuable indeed it is very important that the public is given an opportunity to experience consciously and intelligently the efforts and results of scientific research it is not sufficient that each successive progression is taken up elaborated and applied by a few specialists in the field restricting the body of knowledge to a small group deadens the philosophical spirit of these people and leads to spiritual poverty the corpses of times generations represents a valuable contribution to popular scientific writing the main ideas to theory are extremely well presented moreover the presents state of our knowledge in which the paradigms of science are aptly characterized mr koscijew shows how the criterial growth of our factual knowledge with the striving for a unified conception comprising all empirical data has led to the present situation which is characterized despite all successes by an uncertainty concerning the choice of the basic theoretical concept

the theory and practice of modeling cities and regions as complex self organizing systems presenting widely used cellular automata based models theoretical discussions and applications cities and regions grow or occasionally decline and continuously transform themselves as they do so this book describes the theory and practice of modeling the spatial dynamics of urban growth and transformation as cities are complex adaptive self organizing systems the most appropriate modeling framework is one based on the theory of self organizing systems an approach already used in such fields as physics and ecology the book presents a series of models most of them developed using cellular automata ca which are inherently spatial and computationally efficient it also provides discussions of the theoretical methodological and philosophical issues that arise from the models a case study illustrates the use of these models in urban and regional planning finally the book presents a new dynamic theory of urban spatial structure that emerges from the models and their applications the models are primarily land use models but the more advanced ones also show the dynamics of population and economic activities and are integrated with models in other domains such as economics demography and transportation the result is a rich and realistic representation of the spatial dynamics of a variety of urban phenomena the book is unique in its coverage of both the general issues associated with complex self organizing systems and the specifics of designing and implementing models of such systems

over recent years complexity science has revealed to us new limits to our possible knowledge and control in social cultural and economic systems instead of supposing that past statistics and patterns will give us predictable outcomes for possible actions we now know the world is and will always be creative and surprising continuous structural evolution within such systems may change the mechanisms descriptors problems and opportunities often negating policy aims we therefore need to redevelop our thinking about interventions policies and

policy making moving perhaps to a humbler more learning approach in this handbook leading thinkers in multiple domains set out these new ideas and allow us to understand how these new ideas are changing policymaking and policies in this new era peter m allen cranfield university uk
