since the first edition of this book was published early in 1970 three major developments have occurred in the field of x ray

spectrochemical analysis first wavelength dispersive spectrometry in 1970 already securely established among instrumental analytical methods has matured highly sophisticated miniaturized modular solid state circuitry has replaced electron tube circuitry in the readout system computers are now widely used to program and control fully automated spectrometers and to store process and compute analytical concentrations directly and immediately from accumulated count data matrix effects have largely yielded to mathematical treatment the problems associated with the ultralong wavelength region have been largely surmounted indirect association methods have extended the applicability of x ray spectrometry to the entire periodic table and even to certain classes of compounds modern commercial computerized automatic simultaneous x ray spectrometers can index up to 60 specimens in turn into the measurement position and for each collect count data for up to 30 elements and read out the analytical results in 1 4 min all corrected for absorption enhancement and particle size or surface texture effects and wholly unattended sample preparation has long been the time limiting step in x ray spectrochemical analysis second energy dispersive spectrometry in 1970 only beginning to assume its place among instrumental analytical methods has undergone phenomenal development and application and some believe may supplant wavelength spectrometry for most applications in the foreseeable future

arthur holly compton was one of the great leaders in physics of the twentieth century in this volume robert s shankland who was once a student of compton s has collected and edited the most important of professor compton s papers on x rays the field of his greatest achievement and on other related topics compton entered the field of x ray research in 1913 and carried on active work until the 1930s when he began to specialize in cosmic rays during the years when compton was an active leader in x ray research he made many notable contributions which are reflected in the papers presented here he was the first to prove several important optical properties of x rays including scattering complete polarization and total reflection he was also the first with his student r l doan to use ruled gratings for the production of x ray spectra professor compton s greatest discovery for which he was awarded a nobel prize in 1927 was the compton effect this was the outgrowth of experiments he had initiated during a year at cambridge in 1919 20 he did the major portion of these experiments at washington university in st louis during the period 1920 24 his work demonstrated that in the scattering of x rays by electrons the radiation behaves like corpuscles and that the interaction between the x ray corpuscles and the electrons in the scatter is completely described by the principles of the conservation of energy and momentum for the collisions of particles in his introduction professor shankland gives a historical account of the papers narrates professor compton s early scientific career and shows how he arrived at a quantum explanation of the compton scattering after eliminating all classical explanations

expanding the range of antenna frequency is the main objective of this book solutions proposed are based on the

development of new theoretical methods for analyzing and synthesizing antennas the book shows that concentrated capacitive loads connected along linear and v antennas provide a high level of matching with a cable over a wide frequency range and improves directional characteristics of antennas i e increases the communication distance new theoretical methods are proposed for analysis and synthesis of antennas under consideration 1 method of calculating directional characteristics of radiators with a given current distribution and 2 method of electrostatic analogy for calculating mutual and total fields of complex multi element radiating structures these methods allow us to obtain optimal directional characteristics for director type antennas arrays of yagi uda and log periodic antennas with concentrated capacitances and show that use of capacitors makes it possible to extend the frequency range of the director antennas and to decrease dimensions of the log periodic antennas multi element flat and three dimensional self complementary antennas with different variants of connecting generator poles and cable wires to antenna elements are proposed which improves the matching with a cable characteristics of flat structures are compared with characteristics of volume structures conical parabolic and located on a pyramid edges the book describes new versions of transparent antennas antennas for cellular communication multi tier and multi radiator antennas and much more
