in this highly original and meticulously researched comparison of public and private standards setting, the old maxim that government set safety standards are too severe while those set by the private sector are too lenient, identifying the comparative institutional advantages of each arrangement through four paired case studies of grain elevators, woodstoves, aviation fire safety, and gas space heaters, he finds instead that some private standards are surprisingly strict while government is better positioned to survey real world experience and sponsor research likely to improve standards setting. Setting safety standards challenges those political scientists who argue that only public institutions can advance the public interest in the controversial field of health and safety. He draws attention to such little known organizations as underwriters laboratories and the national fire protection association, private sector alternatives to the government regulation so frequently criticized as time consuming, inflexible, and unreasonable. These organizations, he shows, play a far more significant role in regulation than most federal agencies, even though the standards they develop are widely and often mistakenly assumed to be less concerned with due process than government standards and often unduly lax. This study should be widely read by public policy and regulation experts in both the public and the private sectors as well as by academics in the field.
