this book provides readers with a broad understanding of the fundamental principles driving atmospheric flow over complex terrain and provides historical context for recent developments and future direction for researchers and forecasters the topics in this book are expanded from those presented at the mountain weather workshop which took place in whistler british columbia canada august 5 8 2008 the inspiration for the workshop came from the american meteorological society ams mountain meteorology committee and was designed to bridge the gap between the research and forecasting communities by providing a forum for extended discussion and joint education for academic researchers this book provides some insight into issues important to the forecasting community for the forecasting community this book provides training on fundamentals of atmospheric processes over mountainous regions which are notoriously difficult to predict the book also helps to provide a better understanding of current research and forecast challenges including the latest contributions and advancements to the field the book begins with an overview of mountain weather and forecasting challenges specific to complex terrain followed by chapters that focus on diurnal mountain valley flows that develop under calm conditions and

dynamically driven winds under strong forcing the focus then shifts to other phenomena specific to mountain regions alpine foehn boundary layer and air quality issues orographic precipitation processes and microphysics parameterizations having covered the major physical processes the book shifts to observation and modelling techniques used in mountain regions including model configuration and parameterizations such as turbulence and model applications in operational forecasting the book concludes with a discussion of the current state of research and forecasting in complex terrain including a vision of how to bridge the gap in the future

this book is the first comprehensive presentation of a kaiyu markov model with covariates and a multivariate poisson model with competitive destinations these two models are core techniques when the authors and colleagues conduct their kaiyu studies the two models are usually used to forecast the effects of specific urban redevelopment on both the number of visitors and consumer shop around or kaiyu movements their kaiyu studies originated from the constructions of a kaiyu markov model and the disaggregated hierarchical decision huff model almost simultaneously around the early 1980s this book retrospectively reviews how these models have evolved from the start to the present state and previews the ongoing efforts to make further extensions of these models the extension of the huff model started from the disaggregated hierarchical decision huff model with shop arounds in retrospect the model formulated the consumer s simultaneous choice of destinations as a joint probability the mechanism to determine this joint probability was a recursive conditional probability system now the huff model has shifted from joint probability to multivariate frequency poisson with competitive destinations on the other hand the kaiyu markov model started from a descriptive model because it cannot forecast changes in shop arounds or consumer kaiyu behaviors the kaiyu markov model with covariates was developed in which entrance and shop around choice probabilities are explained by the respective two logit models with covariates such as distances and shop floor areas the noticeable point is that it can explain consumers probability of quitting their shop arounds thus the model enables one to evaluate the effects of urban revitalization policy that promotes consumers shop arounds or kaiyu behaviors furthermore if the kaiyu markov model can estimate the actual numbers of flows of consumers shop arounds among shopping sites the corresponding money flows also can be estimated as economic effects this book discusses from scratch the evolution of all these topics thus this book provides the basics of the kaiyu markov model a

tutorial for the theory and estimation of the conditional logit model and a chapter serving as a practical research manual for forecasting changes caused by urban development based on consumers kaiyu behaviors
