the name temporal logic may sound complex and daunting but while they describe potentially complex scenarios temporal logics are often based on a few simple and fundamental concepts highlighted in this book an introduction to practical formal methods using temporal logic provides an introduction to formal methods based on temporal logic for developing and testing complex computational systems these methods are supported by many well developed tools techniques and results that can be applied to a wide range of systems fisher begins with a full introduction to the subject covering the basics of temporal logic and using a variety of examples exercises and pointers to more advanced work to help clarify and illustrate the topics discussed he goes on to describe how this logic can be used to specify a variety of computational systems looking at issues of linking specifications concurrency communication and composition ability he then analyses temporal specification techniques such as deductive verification algorithmic verification and direct execution to develop and verify computational systems the final chapter on case studies analyses the potential problems that can occur in a range of engineering applications in the areas of robotics railway signalling hardware design ubiquitous computing intelligent agents and information security and explains how temporal logic can improve their accuracy and reliability models temporal notions and uses them to analyze computational systems provides a broad approach to temporal logic across many formal methods including specification verification and implementation introduces and explains freely available tools based on temporal logics and

shows how these can be applied presents exercises and pointers to further study in each chapter as well as an accompanying website providing links to additional systems based upon temporal logic as well as additional material related to the book

a remarkable facet of the human brain is its ability to manage multiple tasks with apparent simultaneity knowledge learned from one task can then be used to enhance problem solving in other related tasks in machine learning the idea of leveraging relevant information across related tasks as inductive biases to enhance learning performance has attracted significant interest in contrast attempts to emulate the human brain's ability to generalize in optimization particularly in population based evolutionary algorithms have received little attention to date recently a novel evolutionary search paradigm evolutionary multi task emt optimization has been proposed in the realm of evolutionary computation in contrast to traditional evolutionary searches which solve a single task in a single run evolutionary multi tasking algorithm conducts searches concurrently on multiple search spaces corresponding to different tasks or optimization problems each possessing a unique function landscape by exploiting the latent synergies among distinct problems the superior search performance of emt optimization in terms of solution quality and convergence speed has been demonstrated in a variety of continuous discrete and hybrid mixture of continuous and discrete tasks this book discusses the foundations and methodologies of developing evolutionary multi tasking algorithms for complex optimization including in domains characterized by factors such as multiple objectives of interest high dimensional search spaces and np hardness

a general framework for constructing and using probabilistic models of complex systems that would enable a computer to use available information for making decisions most tasks require a person or an automated system to reason to reach conclusions based on available information the framework of probabilistic graphical models presented in this book provides a general approach for this task the approach is model based allowing interpretable models to be constructed and then manipulated by reasoning algorithms these models can also be learned automatically from data allowing the approach to be used in cases where manually constructing a model is difficult or even impossible because uncertainty is an inescapable aspect of most real world applications the book focuses on probabilistic models which make the uncertainty explicit and provide models that are more faithful to reality probabilistic graphical models discusses a variety of models spanning bayesian networks undirected markov networks discrete and continuous models and extensions to deal with dynamical systems and relational data for each class of models the text describes the three fundamental cornerstones representation inference and learning presenting both basic concepts and advanced techniques finally the book considers the use of the proposed framework for causal reasoning and decision making under uncertainty the main text in each chapter provides the detailed technical development of the key ideas most chapters also include boxes with additional material skill boxes which describe techniques case study boxes which discuss empirical cases related to the approach described in the text including applications in computer vision robotics natural language understanding and computational biology and concept boxes which present significant concepts drawn from the material in the chapter instructors and readers can group chapters in various combinations from core topics to more technically advanced material to suit their particular needs
