this is the first book devoted to a systematic description of the linear theory of piezoelectric shells and plates theory the book contains two parts in the first part the theories for electroelastic thin walled elements of arbitrary form with different directions of preliminary polarization are presented in an easy form for practical use the approximate methods for integrating the equations of piezoelectric shells and plates are developed and applied for solving some engineering problems in the second part the theory of piezoelectric shells and plates is substantiated by the asymptotic method the area of applicability for different kinds of electroelastic shell theories is studied a new problem concerning the electroelastic phenomena at the edge of a thin walled element is raised and solved the theory of piezoelectric shells and plates will be valuable to researchers working in the field of electroelasticity as well as to electrical and electronic engineers who use thin walled piezoelements it is also be helpful for students and post graduates specializing in mechanics and for scientists concerning asymptotic methods

the first in depth treatment of the major theories of the sublime from longinus to kant

the monograph is about a meta theory of knowledge production process and the logical pathway that connects the epistemic possibility to the epistemic reality it examines the general conditions of paradigms for information processing and isolates the classical and fuzzy paradigms for comparative analysis the sets of conditions that give rise to them are defined stated and analyzed to abstract the corresponding sets of laws of thought the fuzzy paradigm with its corresponding logic and mathematics is related to inexact symbolism for the defective information structure where the results of the knowledge production must satisfy the epistemic conditionality composed of fuzzy conditionality and fuzzy stochastic conditionality under the principle of logical duality with continuum the classical paradigm with its corresponding logic and mathematics is related to exact symbolism for exact information structure where the vagueness component of the defectiveness is assumed away and where the results of the knowledge production must satisfy no epistemic conditionality or at the maximum only the stochastic conditionality under the principle of logical dualism with excluded middle it is argued that the epistemic path that links ontological space to the epistemological space is information the ontological space is taken as the primary category of reality while the epistemological space is shone to be a derivative such information is universally defective and together with assumptions imposed guides the development of paradigms with their laws of thought logic of reasoning mathematics and computational techniques the relational structure is seen in terms of logical trinity with a given example as matter information energy transformational trinity which is supported by the time trinity of past present future relationality the book is written for professionals researchers and students working in philosophy of science decision choice theories economies sciences computer science engineering cognitive psychology and researchers working on or interested in fuzzy paradigm fuzzy logic fuzzy decisions and phenomena of vagueness and ambiguities fuzzy mathematics fuzzy stochastic processes and theory of knowledge it is further aimed at research institutions and libraries the subject matter belongs to extensive research and development taking place on fuzzy phenomena and the debate between the fuzzy paradigm and the classical paradigm relative to informatics synergetic science and complexity theory the book will have a global appeal and across disciplines its strength besides the contents is the special effort that is undertaken

to make it relevant and accessible to different areas of sciences and knowledge production

what is thermodynamics what does statistical physics teach us in the pages of this slim book we confront the answers the reader will discover that where thermodynamics provides a large scale macroscopic theory of the effects of temperature on physical systems statistical mechanics provides the microscopic analysis of these effects which invariably are the results of thermal disorder a number of systems in nature undergo dramatic changes in aspect and in their properties when subjected to changes in ambient temperature or pressure or when electric or magnetic fields are applied the ancients already knew that a liquid a solid or a gas can represent different states of the same matter but what is meant by state it is here that the systematic study of magnetic materials has provided one of the best ways of examining this question which is one of the principal concerns of statistical physics alias statistical mechanics and of modern thermodynamics

many of the important and creative developments in modern mathematics resulted from attempts to solve questions that originate in number theory the publication of

emil grosswald's classic text presents an illuminating introduction to number theory combining the historical developments with the analytical approach. Topics from the theory of numbers offers the reader a diverse range of subjects to investigate including 1 divisibility 2 congruences 3 the riemann zeta function 4 diophantine equations and fermat's conjecture 5 the theory of partitions comprehensive in nature. Topics from the theory of numbers is an ideal text for advanced undergraduates and graduate students alike.

the theory of industrial organization is the first primary text to treat the new industrial organization at the advanced undergraduate and graduate level rigorously. Analytical and filled with exercises coded to indicate level of difficulty it provides a unified and modern treatment of the field with accessible models that are simplified to highlight robust economic ideas while working at an intuitive level to aid students at different levels. Each chapter is divided into a main text and supplementary section containing more advanced material. Each chapter opens with elementary models and builds on this base to incorporate current research in a coherent synthesis. Tirole begins with a background discussion of the theory of the firm. In part i he develops the modern theory of monopoly addressing single product and multi product pricing static and intertemporal price discrimination quality choice reputation and vertical restraints. In part ii Tirole takes up strategic interaction between firms starting with a novel treatment of the bertrand cournot interdependent pricing problem. He studies how capacity constraints repeated interaction product positioning advertising and asymmetric information affect competition or tacit collusion. He then develops topics having to do with long term competition including barriers to entry contestability exit and research and development. He concludes with a game theory user's manual and a section of review exercises. Important notice: the digital edition of this book is missing some of the images found in the physical edition.

the motor theory is about the process by which language emerged and developed and how it functions now in human speech. The concern is with both synchronic and the diachronic aspects of language. Language evolving over time and differentiating over space. In English alone we have half a million words and endless syntactic complexities. As Chomsky has demonstrated add the multitude of other languages that exist and have existed and it is apparent that language is a massive multiply faceted fact in time and space. Where did all the complexity come from? Whence the power of words seen in so many diverse forms of human interaction? How does this thread of sound tie our minds together?

In January 1937 Nobel laureate in physics Subrahmanyan Chandrasekhar was recruited to the University of Chicago. He was to remain there for his entire career becoming Morton D. Hull Distinguished Service Professor of Theoretical Astrophysics in 1952 and attaining emeritus status in 1985. This is where his then student Ed Spiegel met him. During the summer of 1954 attended his lectures on turbulence and jotted down the notes in hand. His lectures had a twofold purpose: they not only provided a very elementary introduction to some aspects of the subject for novices; they also allowed Chandra to organize his thoughts in preparation to formulating his attack on the statistical problem of homogeneous turbulence. After each lecture Ed Spiegel transcribed the notes and filled in the details of the derivations that Chandrasekhar had not included, trying to preserve the spirit of his presentation and even adding some of his side remarks. The lectures were rather impromptu and the notes as presented here.

are as they were set down originally in 1954 now they are being made generally available for chandrasekhar s centennial
