this book aims to pave the way for a new interdisciplinary approach to global cooperation research it does so by bringing in disciplines whose insights about human behaviour might provide a crucial yet hitherto neglected foundation for understanding how and under which conditions global cooperation can succeed as the first profoundly interdisciplinary book dealing with global cooperation it provides the state of the art on human cooperation in selected disciplines evolutionary anthropology and biology decision sciences social psychology complex system sciences written by leading experts the book argues that scholars in the field of global governance should know and could learn from what other disciplines tell us about the capabilities and limits of humans to cooperate this new knowledge will generate food for thought and cause creative disturbances allowing us a different interpretation of the obstacles to cooperation observed in world politics today it also offers first accounts of interdisciplinary global cooperation research for instance by exploring the possibilities and consequences of global we identities by describing the basic cooperation mechanism that are valid across disciplines or by bringing an evolutionary perspective to diplomacy this book will be of great interest to scholars and postgraduates in international relations global governance and international development

have you ever called yourself a pragmatist have you ever wondered what that means aaron zimmerman traces the origins of pragmatism to a theory of belief defended by the nineteenth century scottish philosopher alexander bain and defends a novel take on the pragmatic theory in light of contemporary cognitive neuroscience social psychology and evolutionary biology pragmatists define their beliefs in terms of information poised to guide our more attentive controlled actions zimmerman describes the consequences of this definition for the reader's thinking on the relation between psychology and philosophy the mind and brain the nature of delusion faith pretence racism and more he employs research on animal cognition to argue against the propositional attitude analysis of belief now popular among anglo american philosophers offers pragmatic diagnoses of capgras syndrome and various forms of racial cognition and defends william james famous doctrine of the will to believe zimmerman believes we often have room to believe what we want indeed the adoption of a theory of belief is an instance of this very phenomenon

neurolinguistics is a young and highly interdisciplinary field with influences from psycholinguistics psychology aphasiology and cognitive neuroscience as well as other fields neurolinguistics like psycholinguistics covers aspects of language processing but unlike psycholinguistics it draws on data from patients with damage to language processing capacities or the use of modern neuroimaging technologies such as fmri tms or both the burgeoning interest in neurolinguistics reflects that an understanding

of the neural bases of this data can inform more biologically plausible models of the human capacity for language the oxford handbook of neurolinguistics provides concise overviews of this rapidly growing field and engages a broad audience with an interest in the neurobiology of language the chapters do not attempt to provide exhaustive coverage but rather present discussions of prominent questions posed by given topics the volume opens with essential methodological chapters section i methods covers the key techniques and technologies used to study the neurobiology of language today with chapters structured along the basic divisions of the field section ii addresses the neurobiology of language acquisition during healthy development and in response to challenges presented by congenital and acquired conditions section iii covers the many facets of our articulate brain or speech language pathology and the capacity for language production written spoken and signed questions regarding how the brain comprehends meaning including emotions at word and discourse levels are addressed in section iv finally section v reaches into broader territory characterizing and contextualizing the neurobiology of language with respect to more fundamental neuroanatomical mechanisms and general cognitive domains

the idea of this book is to establish a new scientific discipline noology under which a set of fundamental principles are proposed for the characterization of both naturally occurring and artificial intelligent systems the methodology adopted in principles of noology for the characterization of intelligent systems or noological systems is a computational one much like that of ai many ai devices such as predicate logic representations search mechanisms heuristics and computational learning mechanisms are employed but they are recast in a totally new framework for the characterization of noological systems the computational approach in this book provides a quantitative and high resolution understanding of noological processes and at the same time the principles and methodologies formulated are directly implementable in ai systems in contrast to traditional ai that ignores motivational and affective processes under the paradigm of noology motivational and affective processes are central to the functioning of noological systems and their roles in noological processes are elucidated in detailed computational terms in addition a number of novel representational and learning mechanisms are proposed and ample examples and computer simulations are provided to show their applications these include rapid effective causal learning a novel learning mechanism that allows an ai noological system to learn causality with a small number of training instances learning of scripts that enables knowledge chunking and rapid problem solving and learning of heuristics that further accelerates problem solving semantic grounding allows an ai noological system to truly understand the meaning of the

knowledge it encodes this issue is extensively explored this is a highly informative book providing novel and deep insights into intelligent systems which is particularly relevant to both researchers and students of ai and the cognitive sciences

for an endeavour that is largely based on conversation it may seem obvious to suggest that psychotherapy is discursive after all therapists and clients primarily use talk or forms of discourse to accomplish therapeutic aims however talk or discourse has usually been seen as secondary to the actual business of therapy a necessary conduit for exchanging information between therapist and client but seldom more psychotherapy primarily developed by mapping particular experiential domains in ways responsive to human intervention only recently though has the role that discourse plays been recognized as a focus in itself for analysis and intervention discursive perspectives in therapeutic practice presents an overview of discursive perspectives in therapy along with an account of their conceptual underpinnings the book starts by setting out the case for a discursive and relational approach to therapy by juxtaposing it to the tradition that that leads to the diagnostic approach of the dsm v and medical psychiatry it then presents a thorough review of a range of innovative discursive methods each presented by an authority in their respective area the book shows how discursive therapies can help people construct a better sense of their world and move beyond the constraints caused by the cultural preconceptions opinions and values the client has about the world the book makes a unique contribution to the philosophy and psychiatry literature in examining both the philosophical bases of discursive therapy whilst also showing how discursive perspectives can be applied in real therapeutic situations the book will be of great value and interest to psychotherapists and psychiatrists wishing to understand explore and apply these innovative techniques
