facilities design covers modeling and analysis of the design layout and location of facilities it also covers design and analysis
of materials handling

this book takes a modern view of the field of facilities planning and design along with a unified body of relevant knowledge
motivating and illustrating mathematical models wherever possible the book explores facilities planning capstone design and
even simulation modelling a design project incorporates the theoretical aspects of facilities planning and design the book also
covers decision support methodology and computerized procedures for industrial engineers facilities managers and plant
managers

abstract the functional flowline and cellular layouts are traditional facility layouts that have been discussed in the literature and implemented in industry selection of an appropriate layout for a multi product facility poses a major challenge since the best decomposition of its material flow network is usually achieved by a hybrid layout that must combine the flow and machine grouping attributes of the three traditional layouts unfortunately the systematic layout planning slp design process does not describe specific methods for product mix segmentation and department planning for design of jobshop layouts it lacks a systematic method for varying the manufacturing focus of the different planning departments or activities into which the jobshop can be decomposed we enhance the slp process by integrating production flow analysis pfa into slp adoption of algorithms and principles of pfa in the process of slp can eliminate the two limitations of slp a incapability of using product routings instead of the from to chart as input data and b incapability of generating layouts that are a hybrid combination of functional and cellular layouts a review of the literature shows that a fundamental requirement for the design of modern facility layouts is the distribution of identical machines at multiple locations in the facility our research shows that the material flow network in any facility layout can be decomposed into a network of layout modules with each module representing a portion of the entire facility a layout module is defined as a group of machines connected by a material flow network that exhibits a flow pattern characteristic of a specific type of layout such as the flowline cellular or functional layout the concept of layout modules extends current thinking on input data requirements and methods for facility layout and supports the need for a new generation of facility layouts beyond the three traditional layouts that continue to be studied and implemented in industry we propose a group technology based heuristic approach as an alternative method for generation of layout modules and design of modular layouts based on a new similarity measure for comparison of operation sequences

production planning and control draws on practitioner experiences on the shop floor covering everything a manufacturing or industrial engineer needs to know on the topic it provides basic knowledge on production functions that are essential for the effective use of pp c techniques and tools it is written in an approachable style thus making it ideal for readers with limited knowledge of production planning comprehensive coverage includes quality management lean management factory planning and how they relate to pp c end of chapter questions help readers ensure they have grasped the most important concepts with its focus on actionable knowledge and broad coverage of essential reference material this is the ideal pp c resource to accompany work research or study uses practical examples from the industry to clearly illustrate the concepts presented provides a basic overview of statistics to accompany the introduction to forecasting covers the relevance of pp c to key emerging themes in manufacturing technology including the industrial internet of things and industry 4

winner of the 2003 shingo prize reorganizing work processes into cells has helped many organizations streamline operations shorten lead times increase quality and lower costs cellular manufacturing is a powerful concept that is simple to understand however its ultimate success depends on deciding where cells fit into your organization and then applying the know how to design implement and operate them reorganizing the factory presents a thoroughly researched and comprehensive life cycle approach to competing through cellular work organizations it takes you from the basic cell concept and its benefits through the process of justifying designing implementing operating and improving this new type of work organization in offices and on the factory floor the book discusses many important technical dimensions such as factory analysis cell design planning and control systems and principles for lead time and inventory reduction however unique to the literature it also covers in depth the numerous managerial issues that accompany organizing work into cells in most implementations performance

measurement compensation education and training employee involvement and change management are critically important these issues are often overlooked in the planning process yet they can occupy more of the implementation time than do the technical aspects of cells includes why do cells improve lead time quality and cost planning for cell implementation justifying the move to cells strategically and economically designing efficient manufacturing and office cells selecting and training cell employees compensation system for cell employees performance and cost measurement planning and control of materials and capacity managing the change to cells problems in designing implementing and operating cells improving and adapting existing cells structured frameworks and checklists to help analysis and decision making numerous examples of cells in various industries

this second edition of the classic textbook has been written to provide a completely up to date text for students of mechanical industrial manufacturing and production engineering and is an indispensable reference for professional industrial engineers and managers in his outstanding book professor katsundo hitomi integrates three key themes into the text manufacturing technology production management industrial economics manufacturing technology is concerned with the flow of materials from the acquisition of raw materials through conversion in the workshop to the shipping of finished goods to the customer production management deals with the flow of information by which the flow of materials is managed efficiently through planning and control techniques industrial economics focuses on the flow of production costs aiming to minimise these to facilitate competitive pricing professor hitomi argues that the fundamental purpose of manufacturing is to create tangible goods and it has a tradition dating back to the prehistoric toolmakers the fundamental importance of manufacturing is that it facilitates basic existence it creates wealth and it contributes to human happiness manufacturing matters nowadays we regard manufacturing as operating in these other contexts beyond the technological it is in this unique synthesis that professor hitomi's study constitutes a new discipline manufacturing systems engineering a system that will promote manufacturing excellence key features the classic textbook in manufacturing engineering fully revised edition providing a modern introduction to manufacturing technology production management and industrial economics includes review questions and problems for the student reader

in a context of global competition the optimization of logistics systems is inescapable logistics systems design and optimization falls within this perspective and presents twelve chapters that well illustrate the variety and the complexity of logistics activities each chapter is written by recognized researchers who have been commissioned to survey a specific topic

or emerging area of logistics the first chapter by riopel langevin and campbell develops a framework for the entire book it classifies logistics decisions and highlights the relevant linkages to logistics decisions the intricacy of these linkages demonstrates how thoroughly the decisions are interrelated and underscores the complexity of managing logistics activities each of the chapters focus on quantitative methods for the design and optimization of logistics systems

suitable for engineering and management courses this book intends to develop an understanding of the basic management concepts required in different engineering disciplines and meets the specific requirements of students pursuing b tech m tech courses and mba post graduate diploma in management engineering management

this book constitutes the proceedings of the 6th international conference on advances in information technology iait 2013 held in bangkok thailand in december 2013 the 23 revised papers presented in this volume were carefully reviewed and selected from numerous submissions they deal with all areas related to applied information technology

this comprehensive and up to date text now in its third edition describes how the latest techniques in production planning and control are applied to contemporary industrial setups so as to meet the ever increasing demands in industrial organizations for better quality of services for faster delivery of products and for adapting to the rapid changes taking place in the industrial scenario with the demands in the industrial arena increasingly tending to be lumpy the most effective strategy for planning and controlling production processes cannot be a static preconceived one instead it is one that is flexible and is capable of adapting to the erratic changes in demand patterns evolving such a strategy requires more of practical skill than mere

theoretical knowledge of the subject this book explores the demands of the present day industrial environment and the techniques for addressing these demands through a number of case studies drawn from indian industries the efficacy of various planning strategies the methods for implementing them and their suitability for different industries have been clearly explained in relation to these cases while the essentials of theory have been covered in a simple and straightforward style the stress is on developing the practical skills required to tackle the unpredictable problems and the unforeseen demands that pose a formidable challenge to modern industries the book places emphasis as much on the principles of heuristic techniques as on the systematic approach to production planning this book would serve as a useful textbook to postgraduate students of management as well as undergraduate students of industrial engineering it will be equally useful to the teaching community and the practicing professionals new to the third edition includes a new chapter on lean manufacturing a contemporary manufacturing syndrome chapter 11 provides several references to explore more in the field key features gives solved problems that serve as numerical illustrations of the theoretical concepts the case studies given focus on the indian scenario these will be of great practical value to students and professionals alike offers substantial coverage of the modern heuristic methods the kanban system and the erp techniques
