linear evolution equations in banach spaces have seen important developments in the last two decades this is due to the many different applications in the theory of partial differential equations probability theory mathematical physics and other areas and also to the development of new techniques one important technique is given by the laplace transform it played an important role in the early development of semigroup theory as can be seen in the pioneering monograph by rille and phillips hp57 but many new results and concepts have come from laplace transform techniques in the last 15 years in contrast to the classical theory one particular feature of this method is that functions with values in a banach space have to be considered the aim of this book is to present the theory of linear evolution equations in a systematic way by using the methods of vector valued laplace transforms it is simple to describe the basic idea relating these two subjects let A be a closed linear operator on a banach space X the cauchy problem defined by A is the initial value problem $t \geq 0$ $u'(t) = Au(t)$ $u(0) = x$ where $x \in X$ is a given initial value if u is an exponentially bounded continuous function then we may consider the laplace transform $\int_0^\infty e^{-\lambda t} u(t) dt$ for large real

this book provides an introduction to the use of algebraic methods and symbolic computation for simple quantum systems with applications to large order perturbation theory it is the first book to integrate lie algebras algebraic perturbation theory and symbolic computation in a form suitable for students and researchers in theoretical and computational chemistry and is conveniently divided into two parts the first part chapters 1 to 6 provides a pedagogical introduction to the important lie algebras $so(3)$ $so(2,1)$ $so(4)$ and $so(4,2)$ needed for the study of simple quantum systems such as the d dimensional hydrogen atom and harmonic oscillator this material is suitable for advanced undergraduate and beginning graduate students of particular importance is the use of $so(2,1)$ in chapter 4 as a spectrum generating algebra for several important systems such as the non relativistic hydrogen atom and the relativistic klein gordon and dirac equations this approach provides an interesting and important alternative to the usual textbook approach using series solutions of differential equations
