This volume is a compendium of papers presented during the second triennial symposium on transportation analysis that took place in Capri Italy on June 23-28 1994. The symposium was organized by the Progetto Finalizzato Trasporti and the Istituto di Analisi dei Sistemi ed Informatica of the Italian National Research Council jointly with the Italian Operations Research Society. The purpose of this kind of meetings is to periodically allow an exchange of views and findings by scientists in the field of transportation analysis methods and tools. Therefore the papers presented dealt with a wide range of topics and cover the different aspects of transportation analysis. The material contained in this book gives particular emphasis to the development of mathematical modelling and algorithms. This development is due to the evolution of digital computers and the continuous increase of the computing power. In fact the need of solving large scale problems (crew scheduling network traffic control pollution monitoring and control etc) involves in some cases thousands of variables and therefore sophisticated mathematical models and computational algorithms.

New methodological aspects related to design and implementation of symbolic computation systems are considered in this volume aiming at integrating such aspects into a homogeneous software environment for scientific computation. The proposed methodology is based on a combination of different techniques: algebraic specification through modular approach and completion algorithms approximated and exact algebraic computing methods object oriented programming paradigm automated theorem proving through methods à la Hilbert and methods of natural deduction. In particular the proposed treatment of mathematical objects via techniques for method abstraction structures classification and exact representation the programming methodology which supports the design and implementation issues and reasoning capabilities supported by the whole framework are described.

This book contains 26 papers describing research in the domain of artificial intelligence in medicine. The papers are grouped around the following themes: methodology knowledge representation clinical applications modelling uncertainty management knowledge acquisition and the user perspective. The book gives an

overview of the current state of ai in medicine research in europe it presents several techniques and methods that are likely to play an important role in future applications in the section on clinical applications not only existing systems are described but results of evaluation studies are presented as well

ima volumes 135 transport in transition regimes and 136 dispersive transport equations and multiscale models focus on the modeling of processes for which transport is one of the most complicated components this includes processes that involve a wide range of length scales over different spatio temporal regions of the problem ranging from the order of mean free paths to many times this scale consequently effective modeling techniques require different transport models in each region the first issue is that of finding efficient simulations techniques since a fully resolved kinetic simulation is often impractical one therefore develops homogenization stochastic or moment based subgrid models another issue is to quantify the discrepancy between macroscopic models and the underlying kinetic description especially when dispersive effects become macroscopic for example due to quantum effects in semiconductors and superfluids these two volumes address these questions in relation to a wide variety of application areas such as semiconductors plasmas fluids chemically reactive gases etc
