John Ratey, bestselling author and clinical professor of psychiatry at Harvard Medical School, lucidly explains the human brain's workings and paves the way for a better understanding of how the brain affects who we are. Ratey provides insight into the basic structure and chemistry of the brain and demonstrates how its systems shape our perceptions, emotions, and behavior by giving us a greater understanding of how the brain responds to the guidance of its user. He provides us with knowledge that can enable us to improve our lives in a user's guide to the brain. Ratey clearly and succinctly surveys what scientists now know about the brain and how we use it. He looks at the brain as a malleable organ capable of improvement and change, like any muscle, and examines the way specific motor functions might be applied to overcome neural disorders ranging from everyday shyness to autism. Drawing on examples from his practice and from everyday life, Ratey illustrates that the most important lesson we can learn about our brains is how to use them to their maximum potential.

The special issue presents almost 40 papers on recent research in modeling of pyrometallurgical systems, including physical models, first principles models, detailed CFD and DEM models, as well as statistical models or models based on machine learning. The models cover the whole production chain from raw materials processing through the reduction and conversion unit processes to ladle treatment, casting, and rolling. The papers illustrate how models can be used for shedding light on complex and inaccessible processes characterized by high temperatures and hostile environment in order to improve process performance, product quality or yield, and to reduce the requirements of virgin raw materials and to suppress harmful emissions.

No pyrometallurgical smelter can operate without some form of tapping system. It is the one thing all smelters have in common. This collection discusses this meeting point of the science, technology, and skill involved in this process. The tap hole design process includes a set of design criteria which need to be revised as the results of laboratory, computational fluid dynamics (CFD), and time and motion studies become available. The tap hole life cycle is considered in this volume, with authors addressing the requirements for installation and operability, as well as for maintenance matters such as online monitoring of the tap hole wear. Handling of liquid products and extraction of fumes are all discussed. Although much has been done to make the tapping process as automatic as possible, tapping of smelters cannot be done without labor. Tap floor operators work in harsh environments where safety is of utmost importance. Selection of suitable personnel and intensive training is required and is discussed in this collection.
