tribological processes in valvetrain systems with lightweight valves new research and
modelling provides readers with the latest methodologies to reduce friction and wear in
valvetrain systems a severe problem for designers and manufacturers the solution is
achieved by identifying the tribological processes and phenomena in the friction nodes
of lightweight valves made of titanium alloys and ceramics both cam and camless driven
the book provides a set of structured information on the current tribological problems in
modern internal combustion engines from an introduction to the valvetrain operation to

the processes that produce wear in the components of the valvetrain a valuable resource for teachers and students of mechanical or automotive engineering as well as automotive manufacturers automotive designers and tuning engineers shows the tribological problems occurring in the guide light valve seat insert combines numerical and experimental solutions of wear and friction processes in valvetrain systems discusses various types of cam and camless drives the valves used in valve trains of internal combustion engines both si and ci examines the materials used protective layers and geometric parameters of lightweight valves as well as mating guides and seat inserts
