this volume is one of the two which offer a comprehensive course in those parts of theory and practice of plane and geodetic surveying that are most commonly used by civil engineers the first volume covers in 24 chapters the most common surveying operations each topic introduced is thoroughly described the theory is rigorously developed and a large number of numerical examples are included to illustrate its application general statements of important principles and methods are almost invariably given by practical

illustration apart from illustrations of old and conventional instruments emphasis has been placed on new or modern instruments both for ordinary as well as precise work a good deal of space has been given to instrumental adjustments with thorough discussion of geometrical principles in each case many new advanced problems have also been added which will prove useful for competitive examinations

this book presents in si units the various methods and concepts of surveying laying greater emphasis on those that are commonly used relevant historical aspects are given tracing the development of the subject and the methods the book also gives an overview of certain advanced and modern surveying techniques such as precise traversing and levelling aerial photogrammetry airphoto interpretation electronic distance measurement and remote sensing

plane surveying is a textbook on surveying which provides exhaustive coverage on the subject each chapter is preceded by an introduction to show the contents of the chapter at a glance

the book details on the elementary methods of measurements like tapes and chains to the most advanced ones like remote sensing and photogrammetry the book discusses types of surveying advanced techniques evolved and the methodologies adopted to conduct surveys in logical sequence it systematically elucidates the concepts of land surveying hydrographic surveying compass surveying and so on deriving the formulas through simple geometry trigonometry and differential calculus besides it educates the learner to handle measuring instruments and teaches the ways to take the measurements accurately in steps

this book covers extensive ground in the estimation of mineral resources reserves while covering the classic geometric methods of estimation it extensively presents the modern statistical geostatistical techniques of estimation in doing so the supporting mathematical statistical background essential to facilitating the understanding of modern techniques is also included all information presented in the book is supported by extensive explanatory diagrams the book also covers mine planning scheduling as well as the international codes for classification of ore reserves this book will be of interest to all types of mining geologists as it serves the interests of field geologists involved in surveying drilling and mapping as well as those who are responsible for field data analysis interpretation and defining the geometry of orebodies this book is a comprehensive standalone textbook which is useful for both students and as a source of reference for mining geologists

primarily aimed to be an introductory text for the first course in surveying for civil architecture and mining engineering students this book now in its second edition is also suitable for various professional courses in surveying written in a simple and lucid language this book at the outset presents a thorough introduction to the subject different measurement errors with their types and nature are described along with measurement of horizontal distances and electronic distances measurements this text covers in detail the topics in levelling angles and directions and compass survey the functions and uses of different instruments such as theodolites tacheometers and stadia rods are also covered in the text besides the book elaborates different fields of surveying such as plane table surveying topographical surveying construction surveying and underground surveys finally the book includes a chapter on computer applications in surveying key features includes about 400 figures to explain the fundamentals of surveying uses si units throughout the book offers more than 170 fully solved examples including the questions generated from premier universities provides a large number of problems and answers at the end of each chapter incorporates objective questions from amie exams and indian engineering services exams

the first edition of fundamentals of cartography was published in 1969 by prasaranga university of mysore it was reprinted by the concept publishing company new delhi in while the book remained in currency the cartographic processes changed drastically when information technology brought a sea of change in the sources of information drafting of maps and printing processes drawing maps by hand became obsolete surveying whether ground or aerial was no longer the only major source of information in view of these changes it became necessary to bring out a new edition realising that unless one knows directions scales projections coordinates ground and air surveys one would fail to understand the proper use of modern information technology in the drawing the maps thus the contents of 1969 edition are retained and new chapters have been added to update the book in part ii of the book a chapter on remote sensing and satellite imageries has been added and part v contains chapters on computer aided cartography geographic information system gis land information system lis and global positioning system gps

this volume is continuation with volume i and deals with advanced topics of plane and geodetic surveying the book contains sixteen chapters including four chapters on field astronomy photogrammetric surveying electro magnetic distance measurement edm and remote sensing along with conventional instruments the book also contains illustrations and descriptions of the most modern and advanced measuring instruments such as wild t

2 t 3 and t 4 theodolites electronic theodolites distomats and total station each topic has been thoroughly described the theory is rigorously developed and a large number of numerical examples have been included to illustrate its application the book also contains advanced problems useful for competetive examinations
