the role of learning in the operation of motivational systems in human cognitive development

the metaphor of a cognitive map has attracted interest since the 1940s researchers from many fields have explored how humans process and use spatial information why they make errors or not this text brings together contributors from diverse fields to explore the

our understanding of the way in which animals know how when and where to orient and navigate around their environment has grown considerably over the last decade movement can vary from small displacements in the immediate environment to the long distance migration of salmon or swallows how animals find their way around is both immensely variable and controversial what cues they use and how their senses are involved how much they remember and to what extent they rely on instinctive information or learning behaviour ecology and neurophysiology are all implicated and have been investigated in a wide range of organisms by researchers all over the world individual authors all eminent specialists within their fields have been asked to present reviews of the material in which they are most familiar and to speculate about future directions in the field

flying insects are intelligent micromachines capable of exquisite maneuvers in unpredictable environments understanding these systems advances our knowledge of flight control sensor suites and unsteady aerodynamics which is of crucial interest to engineers developing intelligent flying robots or micro air vehicles mavs the insights we gain when synthesizing bioinspired systems can in turn benefit the fields of neurophysiology ethology and zoology by providing real life tests of the proposed models this book was written by biologists and engineers leading the research in this crossdisciplinary field it examines all aspects of the mechanics technology and intelligence of insects and insectoids after introductory level overviews of flight control in insects dedicated chapters focus on the development of autonomous flying systems using biological principles to sense their surroundings and autonomously navigate a significant part of the book is dedicated to the mechanics and control of flapping wings both in insects and artificial systems finally hybrid locomotion energy harvesting and manufacturing of small flying robots are covered a particular feature of the book is the depth on realization topics such as control engineering electronics mechanics optics robotics and manufacturing this book will be of interest to academic and industrial researchers engaged with theory and engineering in the domains of aerial robotics artificial intelligence and entomology
