the appearance of mapping class groups in mathematics is ubiquitous the book presents 23 papers containing problems about mapping class groups the moduli space of riemann surfaces teichmuller geometry and related areas each paper focusses completely on open problems and directions the problems range in scope from specific computations to broad programs the goal is to have a rich source of problems which have been formulated explicitly and accessibly the book is divided into four parts part i contains problems on the combinatorial and co homological group theoretic aspects of mapping class groups and the way in which these relate to problems in geometry and topology part ii concentrates on connections with classification problems in 3 manifold theory the theory of symplectic 4 manifolds and algebraic geometry a wide variety of problems from understanding billiard trajectories to the classification of kleinian groups can be reduced to differential and synthetic geometry problems about moduli space such problems and connections are discussed in part iii mapping class groups are related both concretely and philosophically to a number of other groups such as braid groups lattices in semisimple lie groups and automorphism groups of free groups part iv concentrates on problems surrounding these relationships this book should be of interest to anyone studying geometry topology algebraic geometry or infinite groups it is meant to provide inspiration for everyone from graduate students to senior researchers

this book investigates the acquisition of sociolinguistic knowledge in the early elementary school years of a mandarin english two way immersion program in the united states using ethnographic observation and quantitative analysis of data the author explores how input from teachers and classmates shapes students language acquisition the book considers the different sociolinguistic messages conveyed by teachers in their patterns of language use and the variety of dialects negotiated and represented using analysis of teacher speech corrective feedback and student language use the author brings together three analyses to form a more complete picture of how children respond to sociolinguistic variation within a two way immersion program

this book is the first in the world literature presenting all new trends in topological fixed point theory until now all books connected to the

topological fixed point theory were devoted only to some parts of this theory this book will be especially useful for post graduate students and researchers interested in the fixed point theory particularly in topological methods in nonlinear analysis differential equations and dynamical systems the content is also likely to stimulate the interest of mathematical economists population dynamics experts as well as theoretical physicists exploring the topological dynamics

this textbook presents some basic stochastic processes mainly markov processes it begins with a brief introduction to the framework of stochastic processes followed by the thorough discussion on markov chains which is the simplest and the most important class of stochastic processes the book then elaborates the theory of markov chains in detail including classification of states the first passage distribution the concept of periodicity and the limiting behaviour of a markov chain in terms of associated stationary and long run distributions the book first illustrates the theory for some typical markov chains such as random walk gambler's ruin problem ehrenfest model and bienayme galton watson branching process and then extends the discussion when time parameter is continuous it presents some important examples of a continuous time markov chain which include poisson process birth process death process birth and

death processes and their variations these processes play a fundamental role in the theory and applications in queuing and inventory models population growth epidemiology and engineering systems the book studies in detail the poisson process which is the most frequently applied stochastic process in a variety of fields with its extension to a renewal process the book also presents important basic concepts on brownian motion process a stochastic process of historic importance it covers its few extensions and variations such as brownian bridge geometric brownian motion process which have applications in finance stock markets inventory etc the book is designed primarily to serve as a textbook for a one semester introductory course in stochastic processes in a post graduate program such as statistics mathematics data science and finance it can also be used for relevant courses in other disciplines additionally it provides sufficient background material for studying inference in stochastic processes the book thus fulfils the need of a concise but clear and student friendly introduction to various types of stochastic processes
