darwin has long been hailed as forefather to behavioural science especially nowadays with the growing popularity of evolutionary psychologies yet until now his contribution to the field of psychology has been somewhat understated this is the first book ever to examine the riches of what darwin himself wrote about psychological matters it unearths a darwin new to contemporary science whose first concern is the agency of organisms from which he derives both his psychology and his theory of evolution a deep reading of darwin s writings on climbing plants and babies blushing and bower birds worms and facial movements shows that for darwin evolution does not explain everything about human action group life and culture are also keys whether we discuss the dynamics of conscience or the dramas of desire thus his treatment of facial actions sets out from the anatomy and physiology of human facial movements and shows how these gain meanings through their recognition by others a discussion of blushing extends his theory to the way reading others expressions rebounds on ourselves i care about how i think you read me this dynamic proves central to how darwin understands sexual desire the production of conscience and of social standards through group dynamics and the role of culture in human agency presenting a new darwin to science and showing how widely darwin s understanding of evolution and agency has been misunderstood and misrepresented in biology and the social sciences this important new book lights a new way forward for those who want to build psychology on the foundation of evolutionary biology

degrees of freedom uncertainty this is the degrees of freedom uncertainty rule which actually allows us freedom we can never be sure which individual went this way and which went the other way that is what entropy and carnot s jinks on maxwell s demons is all about this is a statistical population there are enough members to apply the statistical rule the rule of large numbers that is the same rule just inverted as the degrees of freedom uncertainty principle which says that you cannot specify newtonian activity on populations that provide excellent statistical results because of the same theory of large numbers you can t have your cake and eat it too precisely what carnoy meant also the difficulties with this rule could be resolved easily by applying the viewpoint of harmonics so under the degrees of freedom uncertainty when that applies strongly enough you have harmonics this is the fact that systems under the rule of degrees of freedom uncertainty and that are constrained in certain natural or harmonics ways can form natural patterns harmonics the name refers to the patterns since they form in harmonic kine a set of eigenfunctions the pattern does not specify where any part molecule is at or how fast it is going the pattern is an envelope of probability distribution for the randomly distributed contents this does not allow maxwell s demons to sneak some particles into a special place to violate equilibrium rules demythologizing jung demythologizing and deconstruction is the territory of the post structuralist but reconstruction should be the goal of such endeavors here the deconstruction of jung s archetypes is reconstructed into a meaningful workable and useful concept of how the mind works this effort is about the mind and the algorithms that the mind uses to process information in the brain pictures are a very important part of the information processing but computer processing is approaching that state now as well here the mind is the program that mind can use different algorithms in its programming to solve its problems recognizing these algorithms is our desire for this study i start with jung s archetype algorithms and proceed to expand that into a more complete recognition of mental algorithms the process of understanding conversation is to compare the text of a sentence with contextual information we have the question is how do we store and retrieve the context in our grammar it is not stored using relational algebra which is the method we use to store computer database data for efficient computer store and retrieve mechanisms relational data storage is not fast enough and it is not broad enough in its combinatorial strength to explain the minds process the mind has a way of producing mental objects out of the interpretation of external information a fresh encounter with the outer world is analyzed by a neural network the information is carried by nerves from the sensing point these nerve signals are then filtered through neural networks the archetype jung for that area of mental processing is the link with the conscious from this link a memory object can be extended from the archetype as base class then the extended archetype layer becomes the output layer of the neural network note the archetype layer serves both as the interpretation function determining layer how the input is interpreted and in the instantiation of the object from the base class extended to a memory object from based on the neural interpretation this is a probabilistic process that is under constraints the process is probabilistic but the constraints provide limitations so the result that is controlled by these limitations produces a meaningful pattern thus the constraints prevent dissipation and encourage meaningful results the constraints in the young child are the archetypes as we grow older our minds develop aggregate abstract classes that are useful as though they were archetypes these archetypes and aggregates constrain the mental process so that meaningful patterns result from the interpretation

process the features of the archetypal classes relating to the attributes and methods of a class are then the similar to the neural network activation functions with input our nerves send these signals about our present context these features are used to interpret the signals our internal program adapts them to interpretation of the input signals when applied to a memory object in our conscious mind the features activation functions are used in a way that they make the memory object useful and meaningful in our thought process remember the class here is a hidden layer of the neural network not a single node also an abstract class can be extended into a memory object as a real visible class also see books by dr jerome heath sites google com site jbhcontextcalculus

development is not a purely economic phenomenon it also has a strong sociological element the many faces of socioeconomic change explores how economic socio cultural and political aspects of human progress have been studied since the time of adam smith surveying narratives of how development occurs from early evolutionary models to recent types of development theory it outlines the main long term changes in how socioeconomic development has been envisaged through time the many faces of socioeconomic change presents the argument that socioeconomic development emerged with the creation of grand evolutionary sequences of social progress that were the products of enlightenment and mid victorian thinkers by the middle of the twentieth century when interest in accelerating development gave the topic a new impetus its scope narrowed to a set of economically based strategies after 1960 however faith in such strategies began to wane in the face of indifferent results and a general faltering of confidence in economists boasts of scientific expertise in the twenty first century development research is being pursued using research methods that generate disconnected results as a result it seems unlikely that any grand narrative will be created in the future and that neo liberalism will be the last of this particular kind of socioeconomic theory with a broad scope of content and clear exposition of academic thinking this book guides the reader through the way in which the policy adopted as a consequence of modern theories has been less effective because of the neglect or a misunderstanding of the social context within which they operate
