eurographics workshops on graphics hardware have now become an established forum for an exchange of information concerning the latest developments in this field of growing importance the first workshop took place during eg 86 in lisbon all participants in this event considered it a very rewarding workshop to be repeated at future eg conferences this view was reinforced at the eg 87 hardware workshop in amsterdam which firmly established the need for and a high interest in such a colloquium of technical discussion in this specialist area within the annual eg conference the third eg hardware workshop took place in nice in 1988 and this volume is a record of the fourth workshop at eg 89 in hamburg the material in this book contains papers representing a comprehensive record of the contributions to the 1989 workshop the first part considers algorithms and architectures of graphics systems these papers discuss the broader issues of system design without necessarily raising issues concerning the details of the implementation the second part on systems describes hardware solutions and realisations of machines dedicated to graphics processing many of these contributions make important references to algorithmic and architectural issues as well but there is now a greater emphasis on realisation indeed many vlsi designs are described

develop the skillset essential to successful securitisation swaps management securitisation swaps is a complete practitioner's guide to this unique and complex class of derivatives this detailed examination follows the entire life cycle of securitisation swaps to give quants structurers traders originators issuers and lawyers a common reference for understanding their shared objective broad in scope to provide a common ground perspective yet detailed enough to promote full understanding the discussion takes a distinctly cross disciplinary approach that encompasses the multi faceted knowledge base required to successfully execute these complex trades despite the fact that the size of the market is trillions of dollars in notional principal securitisation swaps have thus far been neglected in both academic and practitioner literature the numerous stakeholders that work together on these complex deals will all greatly benefit from a thorough understanding of their underlying risks and gain deep insight into the perspectives of each stakeholder this invaluable guide provides multi disciplinary insight that allows practitioners to manage securitisation swaps more effectively from pre trade structuring and modelling to post trade risk management and accounting understand the elements of securitisation and covered bonds and how swaps mitigate risk in these types of transactions explore how securitisation swaps differ from other derivatives and delve into their three specific risk

factors swap prepayment risk swap extension risk and downgrade risk learn practical methods and strategies of risk management accounting pricing and transaction execution when securitisation trades go wrong they become front page news but when each participant understands accurate modelling risk mitigation optimal structuring costs pricing commercial backgrounds and other integral practices they are able to work together to achieve a shared objective securitisation swaps provides the essential knowledge that streamlines and safeguards these important trades

this title provides the fundamental bases for developing turbulence models on rational grounds the main different methods of approach are considered ranging from statistical modelling at various degrees of complexity to numerical simulations of turbulence each of these various methods has its own specific performances and limitations which appear to be complementary rather than competitive after a discussion of the basic concepts mathematical tools and methods for closure the book considers second order closure models emphasis is placed upon this approach because it embodies potentials for clarifying numerous problems in turbulent shear flows simpler generally older models are

then presented as simplified versions of the more general second order models the influence of extra physical parameters is also considered finally the book concludes by examining large eddy numerical simulations methods given the book s comprehensive coverage those involved in the theoretical or practical study of turbulence problems in fluids will find this a useful and informative read

since passage of the of no child left behind act in 2001 academic researchers econometricians and statisticians have been exploring various analytical methods of

documenting students academic progress over time known as value added models vams these methods are meant to measure the value a teacher or school adds to student learning from one year to the next to date however there is very little evidence to support the trustworthiness of these models what is becoming increasingly evident yet often ignored mainly by policymakers is that vams are 1 unreliable 2 invalid 3 nontransparent 4 unfair 5 fraught with measurement errors and 6 being inappropriately used to make consequential decisions regarding such things as teacher pay retention and termination unfortunately their unintended consequences are not fully recognized at this point either given such the timeliness of this well researched and thoughtful book cannot be overstated this book sheds important light on the debate surrounding vams and thereby offers states and practitioners a highly important resource from which they can move forward in more research based ways
