smartphone users have come to expect high quality apps this has increased the importance of software testing in mobile software development unfortunately testing apps particularly the gui can be very time consuming exercising every user interface element and verifying transitions between different views of the app under test quickly becomes problematic for example execution of ios gui test suites using apple s ui automation framework can take an hour or more if the app s interface is complicated the longer it takes to run a test the less frequently the test can be run which in turn reduces software quality this book describes how to accelerate the testing process for ios apps using hadoopunit a distributed test execution environment that leverages the parallelism

inherent in the hadoop platform hadoopunit was previously used to run unit and system tests in the cloud it has been modified to perform gui testing of ios apps on a small scale cluster a modest computing infrastructure available to almost every developer experimental results have shown that distributed test execution with hadoopunit can significantly outperform the test execution on a single machine even if the size of the cluster used for the execution is as small as two nodes this means that the approach described in this book could be adopted without a huge investment in it resources hadoopunit is a cost effective solution for reducing lengthy test execution times of system level gui testing of ios apps

dracunculiasis also known as guinea worm disease is caused by infection with the parasitic nematode the guinea worm in may 1986 the thirty ninth world health assembly declared global elimination i.e. eradication of dracunculiasis as a goal the global dracunculiasis eradication campaign through community based interventions has reduced the burden of the disease from an estimated 3.5 million cases per year in 1986 to only 13 human cases and 688 animal infections during 2022 to date however there are no field validated tests to detect the presence of *d. medinensis* specific analytes in the environment although the scale of the

surveillance infrastructure in countries endemic for guinea worm disease is impressive initiating active surveillance and implementing disease preventive interventions in any given area is triggered only when a host with an emergent worm is detected in that area or a nearby area unlike polio eradication where an environmental diagnostic tool exists there is no such tool for dracunculiasis eradication diagnostic tools that can detect evidence of analytes specific to *d medinensis* in environmental samples can be used to identify geographies that are at risk for transmission of *d medinensis* results from such environmental tools can complement surveillance data generated via active community based case and infection searches for subcutaneous and emergent guinea worms and proactive or passive reporting of guinea worm disease as such environmental surveillance tools could augment current surveillance activities and enhance surveillance in a manner unprecedented for the global dracunculiasis eradication campaign viable environmental assays that can detect evidence of analytes nucleic acid or other antigens specific to *d medinensis* in various environmental samples from water aquatic animals and perhaps aquatic animal waste could be used to guide the targeting and implementation of disease preventive interventions in endemic areas for example such tools could further inform which surface water sources should be treated with larvicide environmental surveillance tools could also generate additional data to inform decision making about when and where to contract or expand active community based surveillance and implement other programmatic interventions environmental surveillance tools would be useful for generating additional surveillance data in areas with known or suspected wildlife transmission diagnostic tools capable of detecting *d medinensis* specific analytes in environmental samples would also generate data on the absence of guinea worm in the environment which could help certify countries as free of dracunculiasis transmission ultimately facilitate the certification of dracunculiasis eradication and support post certification efforts
