as well as by the list of open problems in the final section of this monograph the computational power of rational homotopy theory is due to the discovery by quillen 135 and by sullivan 144 of an explicit algebraic formulation in each case the rational homotopy type of a topological space is the same as the isomorphism class of its algebraic model and the rational homotopy type of a continuous map is the same as the algebraic homotopy class of the corresponding morphism between models these models make the rational homology and homotopy of a space transparent they also in principle always and in practice sometimes enable the calculation of other homotopy invariants such as the cup product in cohomology the whitehead product in homotopy and rational lusternik schnirelmann category in its initial phase research in rational homotopy theory focused on the identification of these models these included the identification of rational homotopy invariants in terms of the homotopy lie algebra the translation of the whitehead product to the homotopy groups of the loop space ΩX under the isomorphism $H_1(X) \cong H_1(\Omega X)$ category and cone length since then however work has concentrated on the properties of these invariants and has uncovered some truly remarkable and previously unsuspected phenomena for example if X is an n dimensional simply connected finite cw complex then either its rational homotopy groups vanish in
