the problems arising from the existence of asymmetric information in public decision making have been widely explored by economists most of the traditional analysis of public sector activities has been reviewed to take account of the possible distortions arising from an asymmetric distribution of relevant information among the actors of the public decision making process a normative approach has been developed to design incentive schemes which tackle adverse selection and moral hazard problems within public organisations our understanding of these problems is now much better and some of the mechanisms designed have had important practical implications while this analysis is still under way in many fields of public economics as the papers by Jones and Zanolà and Trimarchi witness a debate is ongoing on the possible theoretical limitations of this approach and on its actual relevance for public sector activities this book encompasses different contributions to these issues on both theoretical and practical areas which were firstly presented at a conference in Catania the innermost problem in the current discussion arises from the fact that this normative analysis is firmly rooted in the complete contracting framework with the consequence that despite the analytical complexities of most models their results rely on very simplified assumptions most complexities of the organisation of public sector and more generally of writing contracts are therefore swept away
