an intermediate level treatment of bayesian hierarchical models and their applications this book demonstrates the advantages of a bayesian approach to data sets involving inferences for collections of related units or variables and in methods where parameters can be treated as random collections through illustrative data analysis and attention to statistical computing this book facilitates practical implementation of bayesian hierarchical methods the new edition is a revision of the book applied bayesian hierarchical methods it maintains a focus on applied modelling and data analysis but now using entirely r based bayesian computing options it has been updated with a new chapter on regression for causal effects and one on computing options and strategies this latter chapter is particularly important due to recent advances in bayesian computing and estimation including the development of rjags and rstan it also features updates throughout with new examples the examples exploit and illustrate the broader advantages of the r computing environment while allowing readers to explore alternative likelihood assumptions regression structures and assumptions on prior densities features provides a comprehensive and accessible overview of applied bayesian hierarchical modelling includes many real data examples to illustrate different modelling topics r code based on rjags jagsui r2openbugs and rstan is integrated into the book emphasizing implementation software options and coding principles are introduced in new chapter on computing programs and data sets available on the book s website

stringent ways of thinking conceptual frameworks are necessary in science the drawback is that the associated assumptions concepts rules and practice may become so deeply entrenched that they turn into tacit knowledge and hence give rise to

constraints in scientific thought and practice that is a new kind of plethora that seriously blinds and thereby hampers scientific progress this book a unifying theory of evolution generated by means of information modelling presents a methodology for describing complex knowledge domains it applies a template information model based on a dynamic structure of interrelated functions called the mereon matrix application of this template model to the field of evolutionary theories enabled the unification of the sometimes chaotic and competing field of evolutionary theories large and small seamlessly in a shared framework the author has masters degrees in both biochemistry and computer science as well as a european doctorate and phd in health informatics and has spent 35 years in full time research it is her particular combination of professional experience and expertise together with the template information model which has enabled her to write this book whilst primarily aimed at a scientific audience and evolutionary biologists in particular the book will be of interest to all those looking for new approaches to exploring and explaining phenomena in nature and because the text is largely non technical in nature much of the content will also be accessible to a wider readership
