the thermodynamics of the atmosphere is the subject of several chapters in most textbooks on dynamic meteorology but there is no work in english to give the subject a specific and more extensive treatment in writing the present textbook we have tried to fill this rather remarkable gap in the literature related to atmospheric sciences our aim has been to provide students of meteorology with a book that can play a role similar to the textbooks on chemical thermodynamics for the chemists this implies a previous knowledge of general thermodynamics such as students acquire in general physics courses therefore although the basic principles are reviewed in the first four chapters they are only briefly discussed and emphasis is laid on those topics that will be useful in later chapters through their application to atmospheric problems no attempt has been made to introduce the thermodynamics of irreversible processes on the other hand consideration of heterogeneous and open homogeneous systems permits a rigorous formulation of the thermodynamic functions of clouds exclusive of any consideration of microphysical effects and a better understanding of the approximations usually implicit in practical applications
