in their search for solutions to problems concerning the dynamics of the earth as a self gravitating body the authors have applied the fundamentals found in their book jacobi dynamics 1987 reidel first satellite observations have shown that the earth does not remain in hydrostatic equilibrium which forms the physical basis of modern geodynamics secondly satellite data have established a relationship between the planet s polar moment of inertia and the potential of the earth s outer force field which proves the most basic point of jacobi dynamics this allowed the authors to revise their derivation of the classical virial theorem introducing the concept of a volumetric force and volumetric moment and so to obtain a generalized virial theorem in the form of jacobi s equation the main dynamical effects are the kinetic energy of oscillation of the interacting particles which explains the physical meaning and nature of gravitational forces separation of shells of a self gravitating body with respect to its mass density differences in angular velocities of the shell s rotation continuity in variance of the potential of the outer gravitational force field together with reductions in the envelope of the interacting masses volumetric center of gravity the nature of earth moon and satellite precession the nature and generating mechanism of the planet s electromagnetic field the common nature of gravitational and electromagnetic energy and other related issues the work is a logical continuation of the book jacobi dynamics and is intended for researchers teachers and students engaged in theoretical and experimental research in various branches of astronomy geophysics planetology and cosmogony and for students of celestial statistical quantum and relativistic mechanics and hydrodynamics

an expanded version of a course on the physics of the earth s interior by an internationally recognised expert in the field it is a reference text providing condensed information on those essential physical topics needed by both the non specialist scientist and student to follow the most recent developments in internal geophysics it is a key to understanding papers covering theoretical geophysics where the basic formulae definitions and theorems cannot be explained in detail due to the limited space and thus enables the reader to remain aware of the continuous progress being made in studying the earth s interior

progress in precambrian geology has been exceptionally great indeed quite striking for geologists of the older generation only some 30 40 years ago the precambrian appeared as an uncertain and even mystic prelude to geologic evolution even the very name precambrian means some indi visible unit in the early history of the earth the beginning of which is poorly known at the same time it was obvious that the precambrian formations are of extremely varied and complex composition and poor knowledge and lack of reliable methods of division and correlation were to blame for the lack of significant progress in studies of this early evolutionary stage of the planet certainly even at the very start of precambrian studies the results obtained were quite promising lifting as they did the mysterious veil over the regional precambrian but they presented no general realistic picture of this early stage in the earth s evolution at that time recently this situation has completely changed due to new methods of study of the older forma tions and due also to the refinement of some well known methods in particular of division dating and correlation of silent metamorphic strata application of different isotope methods of dating was most impor tant in providing objective rock age and thereby the age of geologic events recorded in these rocks thus it became possible to reconstruct the oldest geologic period of our planet
