the present monograph is devoted to the theory of general parabolic boundary value problems the vastness of this theory forced us to take difficult decisions in selecting the results to be presented and in determining the degree of detail needed to describe their proofs in the first chapter we define the basic notions at the origin of the theory of parabolic boundary value problems and give

various examples of illustrative and descriptive character the main part of the monograph chapters ii to v is devoted to a the detailed and systematic exposition of the theory of parabolic boundary value problems with smooth coefficients in hilbert spaces of smooth functions and distributions of arbitrary finite order and with some natural applications of the theory wishing to make the monograph more informative we included in chapter vi a survey of results in the theory of the cauchy problem and boundary value problems in the traditional spaces of smooth functions we give no proofs rather we attempt to compare different results and techniques special attention is paid to a detailed analysis of examples illustrating and complementing the results for mulated the chapter is written in such a way that the reader interested only in the results of the classical theory of the cauchy problem and boundary value problems may concentrate on it alone skipping the previous chapters

why do small caps achieve higher risk adjusted yields than large caps why do stock prices increase or decrease upon an index entry respectively deletion why does january records higher yields than the remaining months of the year these as well as other observed capital market anomalies or phenomena could be insufficiently explained by the classical capital market theory which proceeds on the assumptions that all correspondent information are reflected in the stock prices all negative effects are directly balanced on the market level and that efficiency of arbitrage principle exists as well

as that all market participants act rationally i.e. optimizing their benefits in the sense of the homo economicus this motivated some economists and psychologists to include behavioural scientific findings in their research of the influences on the formation of prices on the capital market in the 1980s the theory of behavioural finance was developed which challenges the homo economicus researchers came to the conclusion that humans are not only acting rational but that they are also influenced by emotions knowledge and experiences this new scientific behavioural oriented theory which is today a separate branch of research contradicts the classical capital market theory and supplies explanations for the observed phenomena on the capital market the aim of this book is to demonstrate how human behaviour influences the development on the capital market and how behavioural finance serves as an explanation for the empirically observed capital market anomalies this book begins with the introduction of the theoretical basis of behavioural finance and its emergence tasks as well as aims will be explained in detail subsequently human's heuristics as well as anomalies and irrationalities in their decision making process will be demonstrated in the third chapter the capital market anomalies or phenomena as well as the irrational and behavioural reasons for their existence will be described the fourth chapter covers empirical evidence for their existence as well as for the insufficient explanatory power of the classical capital market theory concluding a critical acclaim target achievements and perspectives concerning behavioural finance will be given
