this handbook examines the dichotomy between the structure of products and their subgraphs it also features the design of efficient algorithms that recognize products and their subgraphs and explores the relationship between graph parameters of the product and factors extensively revised and expanded this second edition presents full proofs of many important results as well as up to date research and conjectures it illustrates

applications of graph products in several areas and contains well over 300 exercises supplementary material is available on the book's website

when this book was written methods of algebraic topology had caused revolutions in the world of pure algebra to clarify the advances that had been made cartan and eilenberg tried to unify the fields and to construct the framework of a fully fledged theory the invasion of algebra had occurred on three fronts through the construction of cohomology theories for groups lie algebras and associative algebras this book presents a single homology and also cohomology theory that embodies all three a large number of results is thus established in a general framework subsequently each of the three theories is singled out by a suitable specialization and its specific properties are studied the starting point is the notion of a module over a ring the primary operations are the tensor product of two modules and the groups of all homomorphisms of one module into another from these higher order derived operations are obtained which enjoy all the properties usually attributed to homology theories this leads in a natural way to the study of functors and of their derived functors this mathematical masterpiece will appeal to all mathematicians working in algebraic topology

fundamentals of the theory of operator algebras v1

fundamentals of the theory of operator algebras volume i elementary theory provides information pertinent to the fundamental aspects of the theory of operator algebras this book discusses the finite dimensional linear algebra organized into five chapters this volume begins with an overview of the fundamental aspects of linear functional analysis that are needed in the study of operator algebras this text then discusses the continuous linear operators continuous linear functionals weak topologies and convexity in the context of linear topological spaces other chapters consider the elementary geometry of hilbert spaces and the simplest properties of hilbert space operators this book discusses as well algebras that have a banach space structure relative to which the multiplication is continuous the final chapter deals with those C^* algebras that are strong operator closed in their action on some hilbert space which play a

fundamental role in the subject this book is a valuable resource for mathematicians

this volume is the companion volume to fundamentals of the theory of operator algebras volume i elementary theory graduate studies in mathematics series volume 15 the goal of the text proper is to teach the subject and lead readers to where the vast literature in the subject specifically and in its many applications becomes accessible the choice of material was made from among the fundamentals of what may be called the classical theory of operator algebras this volume contains the written solutions to the exercises in the fundamentals of the theory of operator algebras volume i elementary theory

why do winning brands appear to be more creative and authentic than less successful ones despite the strong link between famous brands and the products sold under their name there is still a gap in understanding the relationship between product design and brand building monika hestad plugs that gap branding and product design discusses key questions about the link between product and brand and about design processes and innovation it examines these questions on both macro and micro levels and provides the reader with tools to help understand the role of products in building a brand and how to bring the brand and the product design process together these are based on the author s research into branding and product design her years of teaching these topics and her own industrial practice qualitative interviews delivering an insider perspective on major brands bring abstract concepts to life the book includes case studies from well known and up and coming brands and will prove invaluable to design practitioners marketers managers and other professionals working close to designers it will also benefit those teaching and studying particularly if they are involved in the new higher education programmes where business schools and design schools are co operating to reflect the intersection between design and branding

these volumes are companions to the treatise fundamentals of the theory of operator algebras which appeared as volume 100 i and ii in the series pure and applied mathematics published by academic press in 1983 and 1986 respectively as stated in the preface to those volumes their primary goal is to teach the subject and lead the reader to the point where the vast recent research literature both in the subject proper and in its many applications becomes accessible no attempt was made to be encyclopedic the choice of material was made from among the fundamentals of what may be called the classical theory of operator algebras by way of supplementing the topics selected for presentation in fundamentals a substantial list of exercises comprises the last section of each chapter on

equally important purpose of those exercises is to develop hand on skills in use of the techniques appearing in the text as a consequence each exercise was carefully designed to depend only on the material that precedes it and separated into segments each of which is realistically capable of solution by an attentive diligent well motivated reader

the new 4th edition of Seider's product and process design principles synthesis analysis and design covers content for process design courses in the chemical engineering curriculum showing how process design and product design are inter linked and why studying the two is important for modern applications a principal objective of this new edition is to describe modern strategies for the design of chemical products and processes with an emphasis on a systematic approach this fourth edition presents two parallel tracks 1 product design and 2 process design with an emphasis on process design process design instructors can show easily how product designs lead to new chemical processes alternatively product design can be taught in a separate course subsequent to the process design course

cost management measuring monitoring and motivating performance third canadian edition was written to help students learn to appropriately apply cost accounting methods in a variety of organizational settings to achieve this goal students must also develop professional competencies such as strategic critical thinking risk analysis decision making ethical reasoning and communication this is in line with the cpa curriculum and the content of this edition and the problem materials is mapped to the cpa many students fail to recognize the assumptions limitations behavioural implications and qualitative factors that influence managerial decision making the textbook is written in an engaging step by step style that is accessible to students the authors are proactive about addressing the challenges that instructors and students face in their teaching and learning endeavors they utilize features such as realistic examples real ethical dilemmas self study problems and unique problem material structured to encourage students to think about accounting problems and problem solving more complexly

this book evolved from notes originally developed for a graduate course best approximation in normed linear spaces that i began giving at penn state university more than 25 years ago it soon became evident that many of the students who wanted to take the course including engineers computer scientists and statisticians as well as mathematicians did not have the necessary prerequisites such as a working knowledge of lp spaces and some basic functional analysis today such material is typically contained in the first year graduate course in analysis to accommodate these students i usually ended up spending nearly half the course on these

prerequisites and the last half was devoted to the best approximation part i did this a few times and determined that it was not satisfactory too much time was being spent on the presumed prerequisites to be able to devote most of the course to best approximation i decided to concentrate on the simplest of the normed linear spaces the inner product spaces since the theory in inner product spaces can be taught from first principles in much less time and also since one can give a convincing argument that inner product spaces are the most important of all the normed linear spaces anyway the success of this approach turned out to be even better than i had originally anticipated one can develop a fairly complete theory of best approximation in inner product spaces from first principles and such was my purpose in writing this book

green s functions and infinite products provides a thorough introduction to the classical subjects of the construction of green s functions for the two dimensional laplace equation and the infinite product representation of elementary functions every chapter begins with a review guide outlining the basic concepts covered a set of carefully designed challenging exercises is available at the end of each chapter to provide the reader with the opportunity to explore the concepts in more detail hints comments and answers to most of those exercises can be found at the end of the text in addition several illustrative examples are offered at the end of most sections this text is intended for an elective graduate course or seminar within the scope of either pure or applied mathematics

iteration rules product development but it isn t enough to produce dramatic results this book champions radical product thinking a systematic methodology for building visionary game changing products in the last decade we ve learned to harness the power of iteration to innovate faster we ve invested in a fast car but our ability to set a clear destination and navigate to it hasn t kept up when we iterate without a clear vision or strategy our products become bloated fragmented and driven by irrelevant metrics they catch product diseases that often kill innovation radical product thinking rpt gives organizations a repeatable model for building world changing products the key being vision driven instead of iteration led r dutt guides readers through the five elements of the methodology vision strategy prioritization execution and measurement and culture to develop a clear process for translating vision into reality and turning rpt skills into muscle memory this book offers refreshing solutions to the shortcomings of our current model for product development be prepared to toss out everything you know about a good vision and learn how to measure progress to create revolutionary products the best part you don t have to be a natural born visionary to produce extraordinary results

the authors aim here is to present a precise and concise treatment of those parts of complex analysis that should be familiar to every research mathematician they follow a path in the tradition of ahlfors and bers by dedicating the book to a very precise goal the statement and proof of the fundamental theorem for functions of one complex variable they discuss the many equivalent ways of understanding the concept of analyticity and offer a leisure exploration of interesting consequences and applications readers should have had undergraduate courses in advanced calculus linear algebra and some abstract algebra no background in complex analysis is required
