business applications are designed using profound knowledge about the business domain such as domain objects fundamental domain related principles and domain patterns nonetheless the pattern community's ideas for software engineering have not impacted at the application level they are still mostly used for technical problems this book takes exactly this step it shows you how to apply the pattern ideas in business applications and presents more than 20 structural and behavioral business patterns that use the real resources events agents pattern as a common backbone if you are a developer working on business frameworks you can use the patterns presented to derive the right abstractions e.g. business objects and to design and ensure that the meta rules e.g. process patterns are followed by the developers of the actual applications and if you are an application developer you can use these patterns to design your business application to ensure that it does not violate the domain rules and to adapt the application to changing requirements without the need to change the overall architecture as with patterns in general this approach allows for both more flexible and more solid software architectures and hence better software quality it's a great book marvelous in breadth and depth an impressive achievement i particularly liked the modeling handbook examples bob haugen business technology consultant and contributor to real standardization in iso un cefact and ebxml uk i enjoyed reading it very much it gave many new insights into real and its applications paul johannesson stockholm university and royal institute of technology sweden this book by pavel hruby is destined to become a landmark

in this phd a method was developed to identify systematic patterns of change in visual attention allocation change patterns the change patterns were then integrated into the functional resonance analysis method fram for the generation of models of work as done the change patterns were validated against known changes in visual attention allocation due to shifts in functions of work as done in several eye tracking studies three simulator studies one field study and one experimental study in total approx 50 hours of eye tracking data was analyzed the results of the method were validated quantitatively and qualitatively in the quantitative validation the changes in visual attention allocation due to changes in functions were covered with a mean deviation of approx 13 seconds averaged

over all datasets 2 deviation relative to the recording lengths in the qualitative validation the change patterns produced were found to be plausible for the evaluated studies finally it was demonstrated how the change patterns can be integrated into fram and potentially contribute to the understanding of emergent effects in industries with high levels of automation
